# Enhancing the development of BCI processing pipelines

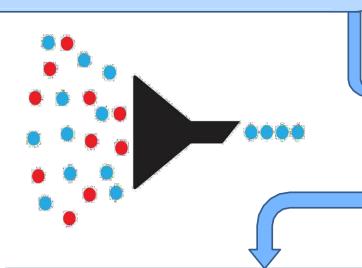

Aaron Lio<sup>1</sup>, Nicolas Ivanov<sup>2</sup>, Tom Chau<sup>2</sup>

<sup>1</sup>University of Toronto, Division of Engineering Science <sup>2</sup>University of Toronto, Institute of Biomedical Engineering

# Background

BCI are technologies that allow users to communicate using only neural activity.

Brain signals must be **processed** before a thought can be extracted.

These processes require **programming experience** and time to build. Furthermore, **minimal code standardization** hinders collaboration/code-sharing.

# **Research Question**

How can a software tool reduce technical barriers and standardize processing code in BCI development?

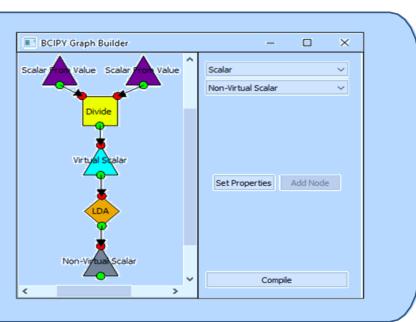

# Methods

**Software Library** Backend

**Drag-and-Drop** pipeline generator to support nocode pipeline development

Seamless integration with BCI interfaces

**Easy-to-use** custom pipeline creator that integrates with new/existing interfaces

# A software tool to reduce technical barriers to Brain Computer Interface (BCI) development

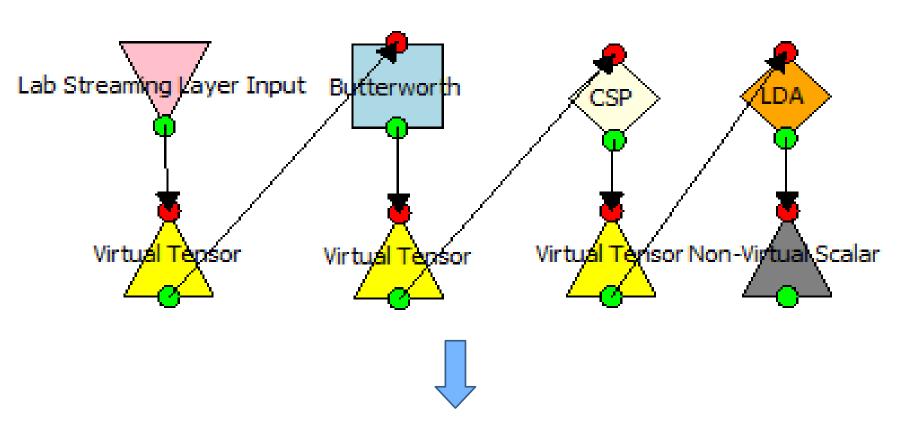

# Holland Bloorview Kids Rehabilitation Hospital

## Results

Building a Standard Processing Pipeline:	
Method	Number of lines of code
MATLAB	~300
Python Backend	~50
Visual Interface	0

### **Standard Processing Pipeline built with the tool**

Minimizes programming knowledge needed to design a processing pipeline

# Conclusion/Next Steps

By enhancing the BCI development process, the tool:

Expands **BCI Clinical Usability** 

Encourages engagement in BCI research from individuals without programming knowledge

Supports inter-lab collaboration and code-sharing by standardizing BCI pipeline processes and code.

Integrations into existing BCI applications will serve to demonstrate the **flexibility**, **robustness**, **and functionality** of BCIPy throughout BCI research.
